

## Data Analytics Assignment - 4: Abalone Age Prediction

Team ID : PNT2022TMID53507

Student Name: V THANGA TAMIL SELVAN

Project Name: Visualizing and Predicting Heart Disease  
with an Interactive Dash Board

Student Roll No: 2127190801092

### Import Necessary packages

+ Code

+ Text

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
sns.set_style("darkgrid")
```

```
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import LabelEncoder
```

```
from sklearn.linear_model import LinearRegression
```

```
from sklearn import metrics
```

### Download and Load the dataset

```
df=pd.read_csv('/content/abalone.csv')
```

### Perform descriptive statistics on the dataset

```
df.head()
```

```
df.tail()
```

	Sex	Length	Diameter	Height	Whole weight	Shucked weight	Viscera weight	Shell weight	Rings
4172	F	0.565	0.450	0.165	0.8870	0.3700	0.2390	0.2490	11

df.drop(df[(df['Diameter'] < 0.6) & (df['age'] > 25)].index, inplace = True)
df.drop(df[(df['Diameter'] >= 0.6) & (df['age'] < 25)].index, inplace = True)
var = 'Height'
plt.scatter(x = df[var], y = df['age'])
plt.grid(True)
```

```
df.drop(df[(df['Height'] > 0.4) & (df['age'] < 15)].index, inplace = True)
df.drop(df[(df['Height'] < 0.4) & (df['age'] > 25)].index, inplace = True)
var = 'Length'
plt.scatter(x = df[var], y = df['age'])
plt.grid(True)
```

## Check for Categorical columns and perform encoding

```
numerical_features = df.select_dtypes(include = [np.number]).columns
categorical_features = df.select_dtypes(include = [np.object]).columns
```

/usr/local/lib/python3.7/dist-packages/ipykernel\_launcher.py:2: DeprecationWarning: `np`  
 Deprecated in NumPy 1.20; for more details and guidance: [https://numpy.org/devdocs/rele:](https://numpy.org/devdocs/release-1.20.0-notes.html)

```
numerical_features
```

```
Index(['Length', 'Diameter', 'Height', 'Whole weight', 'Shucked weight',  

       'Viscera weight', 'Shell weight', 'age', 'Sex_F', 'Sex_I', 'Sex_M'],  

      dtype='object')
```

```
categorical_features
```

```
Index([], dtype='object')
```

```
plt.figure(figsize = (20,7))
sns.heatmap(df[numerical_features].corr(),annot = True)
```

<matplotlib.axes.\_subplots.AxesSubplot at 0x7f89e86a7390>

Whole Weight is almost linearly varying with all other features except age. Height has least linearity with remaining features. Age is most linearly proportional with Shell Weight followed by Diameter and length. Age is least correlated with Shucked Weight.

**KEY INSIGHT** All numerical features but 'sex'

-> Though features are not normally distributed, are close to normality

-> None of the features have minimum = 0 except Height (requires re-check)

-> Each feature has difference scale range

df.columns

```
Index(['Length', 'Diameter', 'Height', 'Whole weight', 'Shucked weight',  
      'Viscera weight', 'Shell weight', 'age', 'Sex_F', 'Sex_I', 'Sex_M'],  
      dtype='object')
```

## Feature Selection and Standardization

```
X = df.drop('age', axis = 1)  
y = df['age']
```

## LINEAR REGRESSION

```
from sklearn.feature_selection import SelectKBest  
from sklearn.preprocessing import StandardScaler  
from sklearn.model_selection import train_test_split, cross_val_score  
standardScale = StandardScaler()  
standardScale.fit_transform(X)  
  
selectkBest = SelectKBest()
```

```

X_new = selectkBest.fit_transform(X, y)

X_train, X_test, y_train, y_test = train_test_split(X_new, y, test_size = 0.25)

lr = LinearRegression()
lr.fit(X_train, y_train)

LinearRegression()

y_train_pred = lr.predict(X_train)
y_test_pred = lr.predict(X_test)

from sklearn.metrics import mean_absolute_error, mean_squared_error
s = mean_squared_error(y_train, y_train_pred)
print('Mean Squared Error of training set :%2f'%s)

p = mean_squared_error(y_test, y_test_pred)
print('Mean Squared Error of testing set :%2f'%p)

Mean Squared Error of training set :3.569916
Mean Squared Error of testing set :3.526501

```

Note: The Lower the Mean Squared Error,better the forecast.

```

from sklearn.metrics import r2_score
s = r2_score(y_train, y_train_pred)
print('R2 Score of training set:%.2f'%s)

p = r2_score(y_test, y_test_pred)
print('R2 Score of testing set:%.2f'%p)

R2 Score of training set:0.53
R2 Score of testing set:0.53

```

Note: The ideal value of R-square is 1.

The closer the value of R-square to 1,better is the model fitted.
